

1. What are the most challenging aspects of the coursework task ?

The most challenging aspects of the coursework task are,when start to do coding have face many problem because we have no any ideas of programming in deepth. By the solving the problem we have do more research to solve the problem.Previously i have no any idea about loop function and other many function that are use to solve the problem.In python programming language have so many modules and function ,so we have to difficult to choose the function and import the module.When we coding the program we mistake many things like comma ,parenthesis,etc so we faces many error in our program.That are the most challenging aspects of the course task.

2. How did you go about completing the task ?

We complete the task to make program which take input from the user to calculate the problem of compound interest .We have take many input from user like user amount user want to invest her money in what percentage ,we know that throw input of the user and how long investor want to invest her money we know throw the input of user and last input is how many time interest compounded per year.That are take input from the user and other is the formula of compound interest is writtes in program so we have the task.

3. What have you learned over the course of completing the course task ?

We have to learn ,how write program to calculate the compound interest and how to playing with coding .By the solving this problem we have to know many thing like in python program how to write and when we need comma parenthesis and other etc sign in python programm that are clear know after the solving this problem. We have also practise, how to write user input and how to import modules.finally we have solve the problem we have more idea how to write coding in python .
